

Proofly

Stop losing "item not received" chargebacks to guesswork.

AI-reviewed dispute evidence, prepared from your own order data and your own policy — self-hosted, so nothing leaves your business except what you choose to send an AI provider.

Evidence scattered across your database, your policy PDF, and your memory.

A customer disputes a chargeback claiming their order never arrived. You have maybe 48 hours to respond to your payment processor with proof — and that proof is spread across order tables, a refund policy nobody has memorized, and whatever the support team remembers about that one order. Most merchants either lose disputes they should win, or spend twenty minutes per case digging through tables by hand.

How Proofly fixes this

1

Read-only, allowlisted access to your order data

Order, payment, fulfillment, refunds, returns, and customer messages — through a connector that can never write, restricted to admin-approved tables and columns.

2

Policy-grounded retrieval

The relevant clause is pulled from your uploaded shipping/refund/terms documents, not a generic policy.

3

AI review against evidence + policy

Claude, GPT, or a local model weighs the case and recommends Contest or Accept, in plain English a non-technical owner can read.

4

A deterministic safety net

The recommendation is checked against your own records before you ever see it.

If the AI recommends contesting an order your own records show was already refunded, Proofly overrides it and routes the case to manual review instead — an LLM can be confidently wrong, so nothing reaches you unchecked.

Built for a real merchant's dispute queue, not a demo.

A

Plain-English case review

"Omar ordered a Wireless Charging Pad on Sep 7 and the order shows as delivered by FedEx on Sep 12... you should contest this chargeback." Not a table dump.

B

Verified policy citations

The AI quotes your actual refund policy, and every quote is checked against the source document text before it's shown to you.

C

A safety net that doesn't trust the AI blindly

Contradicts your own records on a refund or an open return? The case is routed to manual review instead of shown as a confident answer.

D

Works with your real schema

A setup wizard with an AI-assisted "suggest a mapping" step maps Proofly's generic roles onto whatever your tables are actually called.

E

Bring your own AI provider

Anthropic, OpenAI-compatible APIs, or a local model via Ollama. Your API key is encrypted at rest with a key unique to your install.

F

Backup and restore

Download every case, policy, and setting as one zip from Setup, and restore it — to the same machine or a fresh one — just as easily.

Plain English, not a table dump.

2 Susan Anderson

Needs your approval

View draft report

IN PLAIN ENGLISH

Susan ordered a Laptop Stand on Jun 15 and the order shows as delivered by FedEx on Jun 16, with tracking confirming delivery to her address. No refund has been issued and there is no open return. Since the customer claims the order never arrived but your records show it was delivered, you should contest this chargeback.

WHAT YOUR RECORDS SHOW

✓

Order details

Order ORD-2026-100001 placed Jun 15, 2026 - status: delivered - total: \$184.50

From your order records

"A refund will be provided if the item is confirmed lost or never delivered per carrier tracking."

AI RECOMMENDATION

Contest this dispute

How sure the AI is

HIGH

Every case reads like a colleague explaining the situation — order timeline, evidence, and the exact policy clause it was checked against.

Proofly

04

Every case at a glance — and a human decides when the AI isn't sure.

Open, needs-review, and approved disputes in one queue.

Flagged automatically when the safety net finds a contradiction — like an unresolved return request.

Connect your store and policies — no SQL required.

Connect an AI provider and a merchant database in a guided wizard.

Upload your refund and replacement policy once — it's cited automatically from then on.

Self-hosted by design, not as an afterthought.

- Read-only connector — the database connection opens with `setReadOnly(true)`; Proofly cannot write to your store's database.
- Allowlisted, injection-checked — only admin-approved tables/columns are read, re-validated against the live schema before every use.
- Encrypted secrets — your AI provider's API key is encrypted at rest under a key generated uniquely for your install.
- Local by default — the packaged app binds to 127.0.0.1 only; it is not reachable from your network.
- Full audit trail — every sign-in, configuration change, and case decision is recorded.
