

DisputeCopilot

Stop losing "item not received" chargebacks to guesswork. A self-hosted AI copilot that reads your own order records, checks them against your policy, and tells you whether to contest or accept — in plain English.

Self-hosted

Read-only database access

Your choice of AI provider

One-click Windows install

THE PROBLEM

Chargebacks are won or lost in the first 48 hours

A customer disputes a "product not received" chargeback. The proof you need — the order record, the payment, the shipping tracking, the refund history, and your own return policy — is scattered across your database, a PDF, and your memory of what usually happens. Most merchants either lose disputes they should have won, or spend twenty minutes per case digging through tables by hand.

DisputeCopilot's answer: type an order ID. The app reads your own records, checks them against your uploaded policy, and has an AI recommend Contest or Accept — with a plain-English explanation and a confidence score — while a deterministic safety net catches the AI when its recommendation contradicts your own data.

HOW IT WORKS

1 Read-only, allowlisted lookup

The connector reads only admin-approved tables and columns from your own database (or Shopify) — it can never write, and every identifier is validated before use.

2 Retrieve the matching policy clause

Your uploaded refund, shipping, and terms documents are searched for the passage relevant to this case.

3 AI review against evidence + policy

Claude, GPT, or a local model weighs the order evidence against your policy and recommends Contest or Accept, with a confidence score and a plain-English summary.

4 Deterministic safety-net check

If the AI's answer contradicts what the connector actually read — a refund was already issued, or a return is still open — the app overrides it and routes the case to a human instead.

5 You approve → downloadable PDF

Review the draft report, approve it, and download a PDF ready to submit to your payment processor.

Built for a shop owner, not a database admin

Plain-English case review

No table dumps or jargon. "Omar ordered a Wireless Charging Pad on Sep 7 and the order shows as delivered by FedEx on Sep 12 — you should contest this chargeback."

Policy-grounded citations

The AI quotes your actual refund policy, not a generic one — and every quote is verified against the document text before it's ever shown to you.

A safety net that checks the AI

Recommending "contest" on an order your own records show was refunded, or an order with an open return request, is caught and routed to manual review automatically.

Works with your real schema

A setup wizard — with an AI-assisted "suggest a mapping" step — maps your actual tables and columns, including customer names that live in a separate customers table.

Read-only, injection-safe

The database connection is opened read-only. Every table and column name is re-validated against your live schema before it's used in a query.

Bring your own AI provider

Anthropic, OpenAI-compatible APIs, or a local model via Ollama. Your API key is encrypted at rest with a key unique to your install.

Full audit trail

Every login, setup change, and decision is logged — useful evidence in itself if a payment processor asks how a decision was made.

One-click PDF export

An approved report downloads as a clean PDF, ready to attach to your payment processor's dispute response form.

A case, reviewed

The AI reads the order, payment, and shipping records, checks them against your policy, and recommends a decision

1042 Omar Anderson

Needs your approval

IN PLAIN ENGLISH

Omar ordered a Wireless Charging Pad on Sep 7 and the order shows as delivered by FedEx on Sep 12, with tracking confirming delivery to his address. No refund has been issued. Since the customer claims the order never arrived but your records show it was delivered, you should contest this chargeback.

"A refund will be provided if the item is confirmed lost or was never delivered per carrier tracking."

AI RECOMMENDATION

Contest this dispute

How sure the AI is

△ No refund is on record — since you're contesting, do not refund the customer.

owner@merchantsshop.com Admin

1

Evidence, dated and sourced

Order, payment, and shipping records are read straight from your database and shown with the date each event happened and which of your records it came from.

2

Gaps are called out, not hidden

"No refund on record" is shown as plainly as evidence that was found — a missing record is itself part of the case.

3

A real quote, not a paraphrase

The policy excerpt is copied verbatim from your uploaded document and checked against the source text before it's shown.

4

Confidence, not false certainty

The AI's confidence is shown alongside the recommendation, so a low-confidence call reads differently from a high-confidence one.

SETTINGS

Setup

One-time setup, in three steps: 1. choose an AI provider, 2. connect your store, 3. choose which order details the AI may read. You can come back and change these any time.

Integrations

Password

1 Choose your AI provider

The AI reads each disputed order and writes a recommendation. Pick the company you have an account with, paste the API key from their website, click **Save**, then **Test connection**. Leave the server address and AI model as they are unless your provider told you otherwise. Your key stays on this computer and is never shown again after saving.

Provider

Anthropic (Claude)

Server address

https://api.anthropic.com

AI model

claude-haiku-4-5

API key

paste your API key

Not set up yet

Save

Test connection

2 Connect your store

Tell DisputeCopilot where your orders live so it can look them up. Access is read-only — it can never change, delete or add anything in your store. Until you connect, investigations use built-in sample data.

Where are your orders?

My own database (PostgreSQL)

Your data stays yours

DisputeCopilot is self-hosted by design. It runs on your own machine, against your own database, and the only data that ever leaves it is what you explicitly send to the AI provider you choose.

- ✓ **Read-only connector**
The database connection is opened with `setReadOnly(true)` — the app cannot write to your store's database even if it tried.
- ✓ **Allowlisted and injection-checked**
Only admin-approved tables and columns can be read. Every identifier is re-validated against the live schema and checked against a strict pattern before it ever reaches a SQL string.
- ✓ **Encrypted secrets, per-install key**
Your AI provider's API key is encrypted at rest (AES-GCM) under a key generated uniquely for your install — not a key baked into the app.
- ✓ **Local by default**
The packaged app binds to 127.0.0.1 only. It is not reachable from your network.
- ✓ **No shared credentials**
Each install creates its own admin account on first run — there is no default password shipped with the product.
- ✓ **Full audit trail**
Every sign-in, configuration change, and case decision is recorded for later review.

TECHNOLOGY

LAYER	TECHNOLOGY
Backend	Java 21, Spring Boot 4, Spring Security, PostgreSQL, Flyway
Frontend	React, TypeScript, Vite
AI	Direct HTTP to Anthropic / OpenAI-compatible endpoints, including local models via Ollama
Policy retrieval	Keyword-overlap scoring over uploaded documents — no vector database required
Packaging	jpackage + embedded PostgreSQL, bundled into one Windows installer

Get started

Download the Windows installer, or run it from source with Java 21, Node, and Docker. See the README for both.

Screenshots in this document use synthetic demo data from a local test database — not any real merchant's records.
